# Deploy a Kubernetes Cluster with NVIDIA DeepOps Automated Deployment

To deploy and configure the Kubernetes Cluster with NVIDIA DeepOps, complete the following steps:

1. Make sure that the same user account is present on all the Kubernetes master and worker nodes.
2. Clone the DeepOps repository.

```
git clone https://github.com/NVIDIA/deepops.git
```

3. Check out a recent release tag.

```
cd deepops  
git checkout tags/20.08
```

If this step is skipped, the latest development code is used, not an official release.

4. Prepare the Deployment Jump by installing the necessary prerequisites.

```
./scripts/setup.sh
```

5. Create and edit the Ansible inventory by opening a VI editor to `deepops/config/inventory`.
  - a. List all the master and worker nodes under [all].
  - b. List all the master nodes under [kube-master]
  - c. List all the master nodes under [etcd]
  - d. List all the worker nodes under [kube-node]

```
#####
# ALL NODES
# NOTE: Use existing hostnames here, DeepOps will conf
#####
[all]
hci-ai-k8-master-01      ansible_host=172.21.232.114
hci-ai-k8-master-02      ansible_host=172.21.232.115
hci-ai-k8-master-03      ansible_host=172.21.232.116
hci-ai-k8-worker-01      ansible_host=172.21.232.109
hci-ai-k8-worker-02      ansible_host=172.21.232.110

#####
# KUBERNETES
#####
[kube-master]
hci-ai-k8-master-01
hci-ai-k8-master-02
hci-ai-k8-master-03

# Odd number of nodes required
[etcd]
hci-ai-k8-master-01
hci-ai-k8-master-02
hci-ai-k8-master-03

# Also add mgmt/master nodes here if they will run non
[kube-node]
hci-ai-k8-worker-01
hci-ai-k8-worker-02

[k8s-cluster:children]
kube-master
kube-node
```

6. Enable GPUOperator by opening a VI editor to `deepops/config/group_vars/k8s-cluster.yml`.

```
# Provide option to use GPU Operator instead of setting up NVIDIA driver and
# Docker configuration.
deepops_gpu_operator_enabled: true
```

7. Set the value of `deepops_gpu_operator_enabled` to true.
8. Verify the permissions and network configuration.

```
ansible all -m raw -a "hostname" -k -K
```

- If SSH to the remote hosts requires a password, use -k.
- If sudo on the remote hosts requires a password, use -K.

9. If the previous step passed without any issues, proceed with the setup of Kubernetes.

```
ansible-playbook --limit k8s-cluster playbooks/k8s-cluster.yml -k -K
```

10. To verify the status of the Kubernetes nodes and the pods, run the following commands:

```
kubectl get nodes
```

```
rarvind@deployment-jump:~/deepops$ kubectl get nodes
NAME                                STATUS    ROLES    AGE    VERSION
hci-ai-k8-master-01                Ready     master   2d19h  v1.17.6
hci-ai-k8-master-02                Ready     master   2d19h  v1.17.6
hci-ai-k8-master-03                Ready     master   2d19h  v1.17.6
hci-ai-k8-worker-01                Ready     <none>    2d19h  v1.17.6
hci-ai-k8-worker-02                Ready     <none>    2d19h  v1.17.6
```

```
kubectl get pods -A
```

It can take a few minutes for all the pods to run.

```

rarvind@deployment-jump:~/deepops$ kubectl get pods -A

```

```

12. Install Helm on the Deployment Jump.

```
./scripts/install_helm.sh
```

13. Remove the taints on the master nodes.

```
kubectl taint nodes --all node-role.kubernetes.io/master-
```

This step is required to run the LoadBalancer pods.

14. Deploy LoadBalancer.

15. Edit the `config/helm/metallb.yml` file and provide a range of IP addresses in the **Application Network** to be used as LoadBalancer.

```
---
# Default address range matches private network for the virtual cluster
# defined in virtual/.
# You should set this address range based on your site's infrastructure.
configInline:
  address-pools:
    - name: default
      protocol: layer2
      addresses:
        - 172.21.231.130-172.21.231.140#Application Network
controller:
  nodeSelector:
    node-role.kubernetes.io/master: ""
```

16. Run a script to deploy LoadBalancer.

```
./scripts/k8s_deploy_loadbalancer.sh
```

17. Deploy an Ingress Controller.

```
./scripts/k8s_deploy_ingress.sh
```
