# Deploy and Configure ONTAP Select in the VMware Virtual Infrastructure (Automated Deployment)

To deploy and configure an ONTAP Select instance within the VMware Virtual Infrastructure, complete the following steps:

- 1. From the Deployment Jump VM, login to the NetApp Support Site and download the ONTAP Select OVA for ESXi.
- 2. Create a directory OTS and obtain the Ansible roles for deploying ONTAP Select.

```
mkdir OTS
cd OTS
git clone https://github.com/NetApp/ansible.git
cd ansible
```

3. Install the prerequisite libraries.

```
pip install requests
pip install pyvmomi
Open a VI Editor and create a playbook 'ots_setup.yaml' with the below content to
deploy the ONTAP Select OVA and initialize the ONTAP cluster.
- name: Create ONTAP Select Deploy VM from OVA (ESXi)
  hosts: localhost
  gather facts: false
  connection: 'local'
  vars files:
    - ots_deploy_vars.yaml
  roles:
    - na ots deploy
- name: Wait for 1 minute before starting cluster setup
  hosts: localhost
  gather facts: false
  tasks:
  - pause:
      minutes: 1
- name: Create ONTAP Select cluster (ESXi)
  hosts: localhost
  gather facts: false
  vars files:
  ots_cluster_vars.yaml
  roles:
    - na ots cluster
```

4. Open a VI editor, create a variable file ots\_deploy\_vars.yaml, and fill in hte following parameters:

```
target_vcenter_or_esxi_host: "10.xxx.xx.xx"# vCenter IP
host_login: "yourlogin@yourlab.local" # vCenter Username
ovf path: "/run/deploy/ovapath/ONTAPdeploy.ova"# Path to OVA on Deployment Jump VM
datacenter_name: "your-Lab"# Datacenter name in vCenter
esx_cluster_name: "your Cluster"# Cluster name in vCenter
datastore name: "your-select-dt"# Datastore name in vCenter
mgt_network: "your-mgmt-network"# Management Network to be used by OVA
deploy_name: "test-deploy-vm"# Name of the ONTAP Select VM
deploy_ipAddress: "10.xxx.xx.xx"# Management IP Address of ONTAP Select VM
deploy_gateway: "10.xxx.xx.1"# Default Gateway
deploy_proxy_url: ""# Proxy URL (Optional and if used)
deploy netMask: "255.255.255.0"# Netmask
deploy_product_company: "NetApp"# Name of Organization
deploy_primaryDNS: "10.xxx.xx.xx"# Primary DNS IP
deploy_secondaryDNS: ""# Secondary DNS (Optional)
deploy_searchDomains: "your.search.domain.com"# Search Domain Name
```

Update the variables to match your environment.

5. Open a VI editor, create a variable file ots\_cluster\_vars.yaml, and fill it out with the following parameters:

```
node_count: 1#Number of nodes in the ONTAP Cluster
monitor_job: truemonitor_deploy_job: true
deploy api url: #Use the IP of the ONTAP Select VM
deploy_login: "admin"
vcenter_login: "administrator@vsphere.local"
vcenter_name: "172.21.232.100"
esxi_hosts:
  - host name: 172.21.232.102
  - host name: 172.21.232.103
cluster_name: "hci-ai-ots"# Name of ONTAP Cluster
cluster_ip: "172.21.232.118"# Cluster Management IP
cluster_netmask: "255.255.255.0"
cluster gateway: "172.21.232.1"
cluster_ontap_image: "9.7"
cluster_ntp:
  - "10.61.186.231"
cluster_dns_ips:
  - "10.61.186.231"
cluster dns domains:
  - "sddc.netapp.com"
mgt_network: "NetApp HCI VDS 01-Management_Network"# Name of VM Port Group for Mgmt
data_network: "NetApp HCI VDS 01-NFS_Network"# Name of VM Port Group for NFS Network
internal_network: ""# Not needed for Single Node Cluster
instance_type: "small"
cluster_nodes:
  - node_name: "{{ cluster_name }}-01"
    ipAddress: 172.21.232.119# Node Management IP
    storage_pool: NetApp-HCI-Datastore-02 # Name of Datastore in vCenter to use
    capacityTB: 1# Usable capacity will be ~700GB
    host_name: 172.21.232.102# IP Address of an ESXi host to deploy node
```

Update the variables to match your environment.

6. Start ONTAP Select setup.

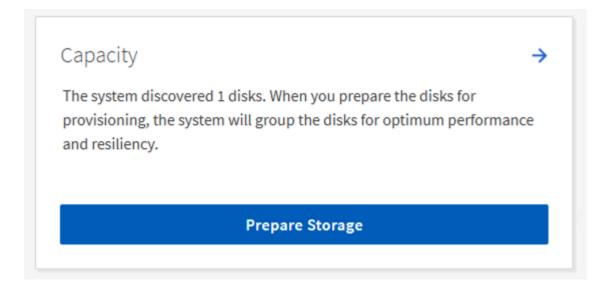

```
ansible-playbook ots_setup.yaml --extra-vars deploy_pwd=$'"P@ssw0rd"' --extra-vars vcenter_password=$'"P@ssw0rd"' --extra-vars ontap_pwd=$'"P@ssw0rd"' --extra-vars host_esx_password=$'"P@ssw0rd"' --extra-vars deploy_password=$'"P@ssw0rd"'
```

7. Update the command with deploy\_pwd `(ONTAP Select VM instance), `vcenter\_password(vCenter), ontap\_pwd (ONTAP login password), host\_esx\_password (VMware ESXi), host\_password (vCenter), and deploy\_password (ONTAP Select VM instance).

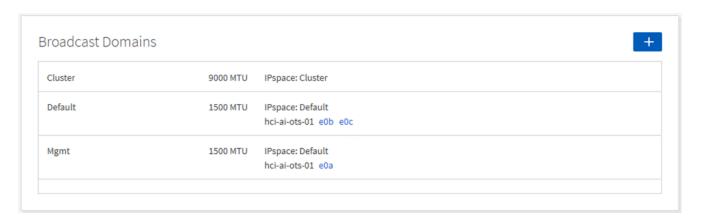

# Configure the ONTAP Select Cluster – Manual Deployment

To configure the ONTAP Select cluster, complete the following steps:

- 1. Open a browser and log into the ONTAP cluster's System Manager using its cluster management IP.
- 2. On the DASHBOARD page, click Prepare Storage under Capacity.

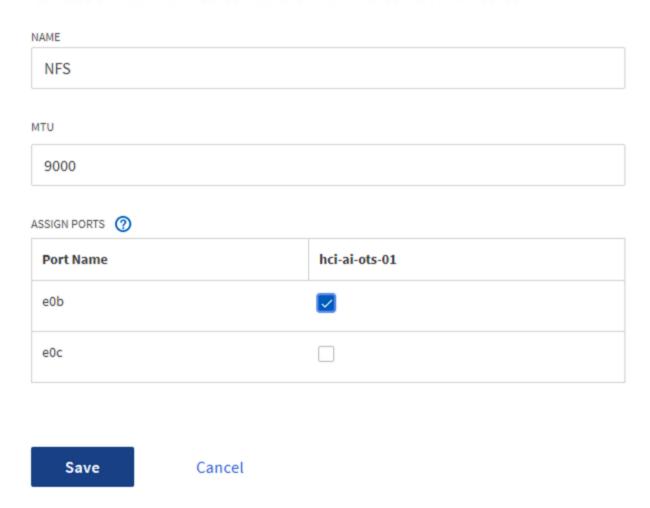

- 3. Select the radio button to continue without onboard key manager, and click Prepare Storage.
- 4. On the NETWORK page, click the + sign in the Broadcast Domains window.

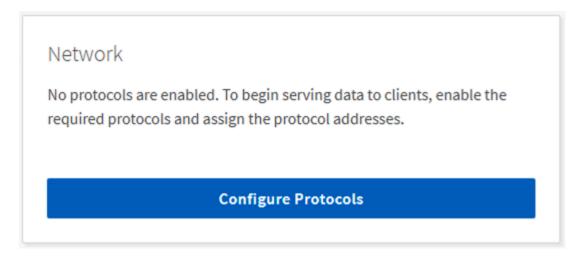

5. Enter the Name as NFS, set the MTU to 9000, and select the port e0b. Click Save.

### **Add Broadcast Domain**

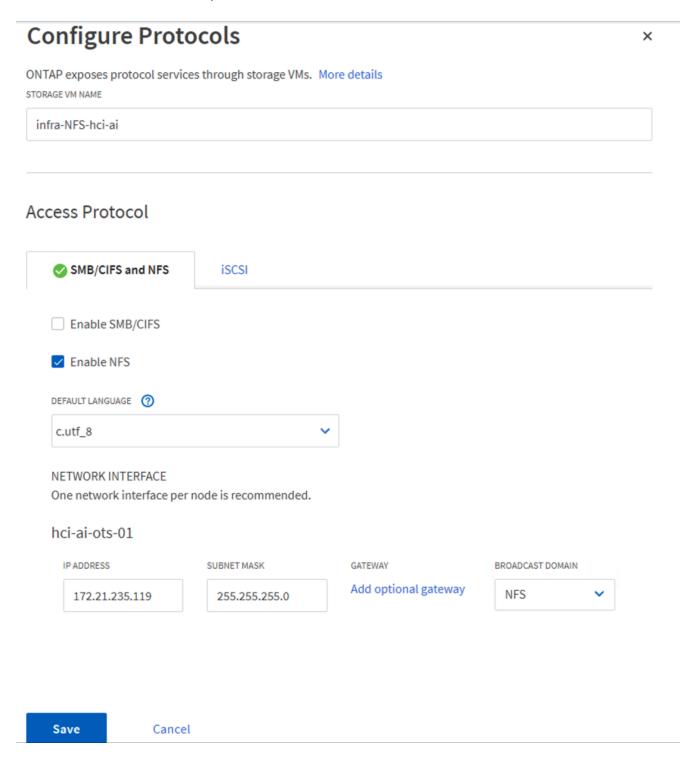

Specify the following details to add a new broadcast domain.

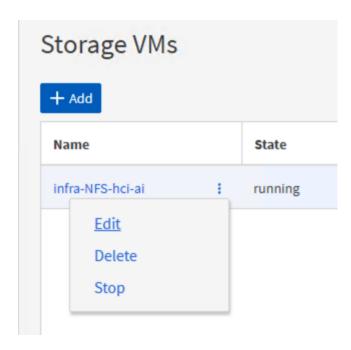

6. On the DASHBOARD page, click Configure Protocols under Network.

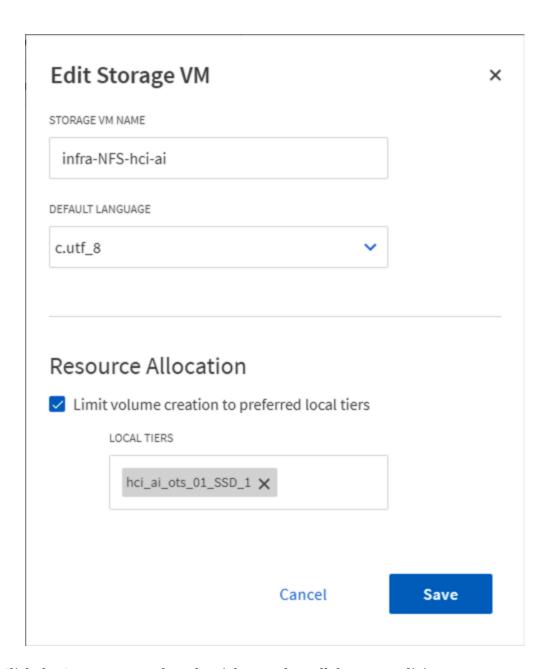

7. Enter a name for the SVM, select Enable NFS, provide an IP and subnet mask for the NFS LIF, set the Broadcast Domain to NFS, and click Save.

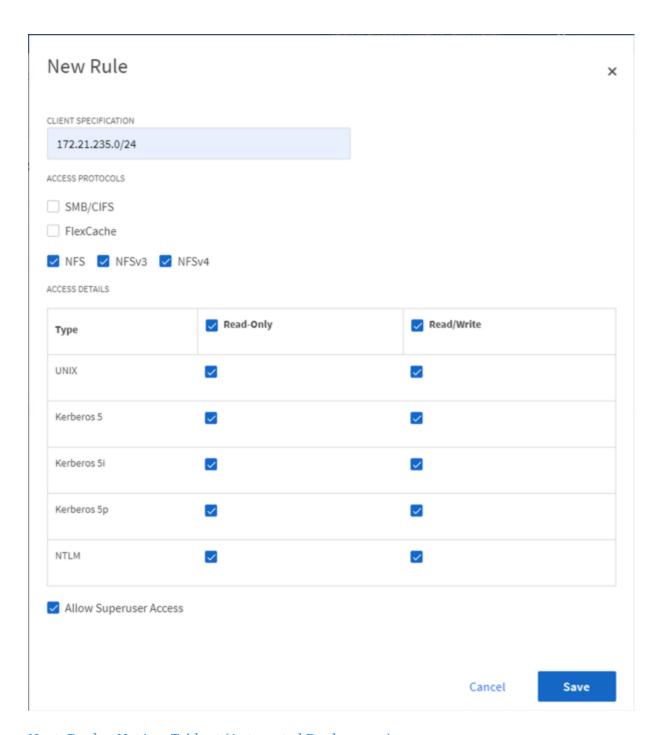

- 8. Click STORAGE in the left pane, and from the dropdown select Storage VMs
  - a. Edit the SVM.

b. Select the checkbox under Resource Allocation, make sure that the local tier is listed, and click Save.

- 9. Click the SVM name, and on the right panel scroll down to Policies.
- 10. Click the arrow within the Export Policies tile, and click the default policy.
- 11. If there is a rule already defined, you can edit it; if no rule exists, then create a new one.
  - a. Select NFS Network Clients as the Client Specification.
  - b. Select the Read-Only and Read/Write checkboxes.
  - c. Select the checkbox to Allow Superuser Access.

Next: Deploy NetApp Trident (Automated Deployment)
